#### **Code to Review**

The code to be reviewed is the product turned in for *Iteration 2*.

## **App Structure Diagram**

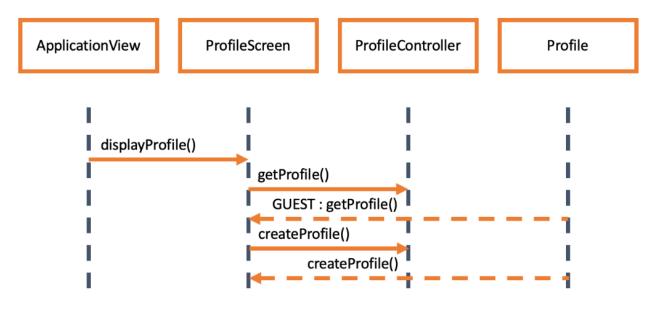

| Iteration 2 Classes                             |                                      |                                                  |
|-------------------------------------------------|--------------------------------------|--------------------------------------------------|
| app.views                                       | app.controllers                      | app.models                                       |
| ApplicationView<br>AboutScreen<br>ProfileScreen | AboutController<br>ProfileController | Profile ProfileReader ProfileWriter Team Version |

## **User Stories Supported**

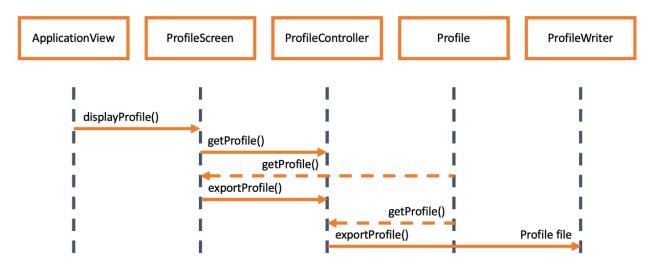

For the user to see the software version and miscellaneous information, the application displays the **AboutScreen** from the application. The **AboutScreen**, a JPanel, grabs the data from the **Version** and **Team** objects. The profile data is retrieved from the **Profile** object thru the **ProfileController**.

USX05: As a user I want to enter settings such as my first name and email address

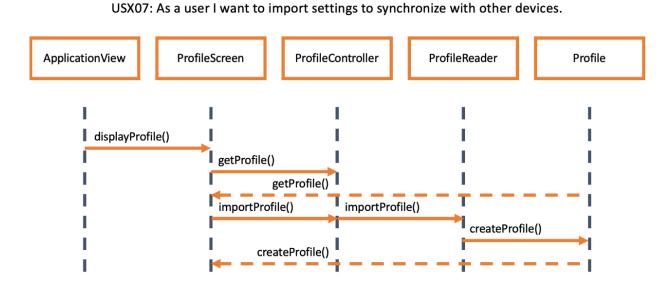

By default, the program will generate a GUEST <u>Profile</u> object in the absence of existing profiles. The user desires to create a profile, navigating to the <u>ProfileScreen</u> from the <u>ApplicationView</u>. To create a profile, the user inputs a first name and email address.

USX06: As a user I want to export settings (name and email) for synchronization to other devices.

For the user to export profile data, the user must navigate to the **ProfileScreen**. Clicking on an export button will write the data from the **Profile** object to a local file facilitated by the **ProfileWriter** class.

For the user to import profile data, the user must navigate to the **ProfileScreen**. Clicking on an import button will read a local file that the user passes thru using the operating system's file choosing apparatus. This is facilitated by the **ProfileReader** class in-app, creating a **Profile** object from the read data.

#### **Coding Conventions Followed**

Javadoc standards (atlassian.com)
